

Trilock

The Trilock is in simple terms, a turnstile that is ideal for monitored access control. The passage is straightforward and familiar to most users, resulting in a high capacity user flow. The three stainless steel arms are mounted on a choice of stainless steel units. This

system allows access in one or two directions, for example, controlled by a card reader or a push button system at a reception desk. Additionally it is possible, on command, to block access completely or alternatively to create a free passage. Depending on the

mechanism the horizontal arm can be dropped or the mechanism can freely rotate. To create an entrance for wheelchairs, trolleys or large goods, an additional Winglock or Twinglock is advised.

Trilock 300

- Collapsible arm set available.
- In each direction five working principles possible.
- A completely stainless steel robust Trilock solution.
- A space efficient Trilock on a pedestal.
- Sensors to prevent unauthorised passage over or under the arm set possible.
- Various solutions for integrating signals within the housing.
